

Preliminary Results:

Rain at the Ice Edge & AMSR-E in XCAL

Tom Wilheit
Texas A&M Univ.

Rain at the Ice Edge

Problem:

Viewed simply, Sea Ice and rain look similar.
Can we tell them apart?

Temporal continuity is one approach
Inconvenient.

Wouldn't expect polarization to be useful here.
What about the spectral characteristics?
We will look at it through the TAMU rain algorithm.
with a few modifications for high latitude work.

Apparent Rain Rates (10 GHz Resolution)

Apparent Rain Rates (18 GHz Resolution(well almost))

Rain at Ice Edge

When Ice Substantially Fills the FOV, Rain Retrievals are Inconsistent.

Near the Ice Edge, Not So Much.

Need to Look at More Cases.

What is X-CAL?

OBJECTIVE

To make the GPM rain data set as clean and self-consistent as possible

CONTEXT: 3 Layer Process

**Calibrate individual instruments as well as possible
Instrument Manufacturers**

Cross Calibrate instruments

Intercalibration (X-CAL) Working Group

**Statistical Comparisons at Rain Retrieval Level
Algorithm Teams**

**Develop techniques for comparing similar, but not identical,
microwave radiometers**

**Develop implementation strategy for routine intercalibration of
constellation radiometers**

Develop Traps and corrections for recurring instrument errors.s.

X-CAL Status

**TMI/Windsat Comparison in cleanup stage.
Consensus Standard (Mark 1)**

Starting to bring AMSR-E into X-CAL

Process

Prescreen Data:

Unphysical Data

Scan-wise Anomalies

Orbit-wise Anomalies

Compare Tbs

Matchup Data Set

Limiting Value Approaches

Generate adjustments to Consensus Standard

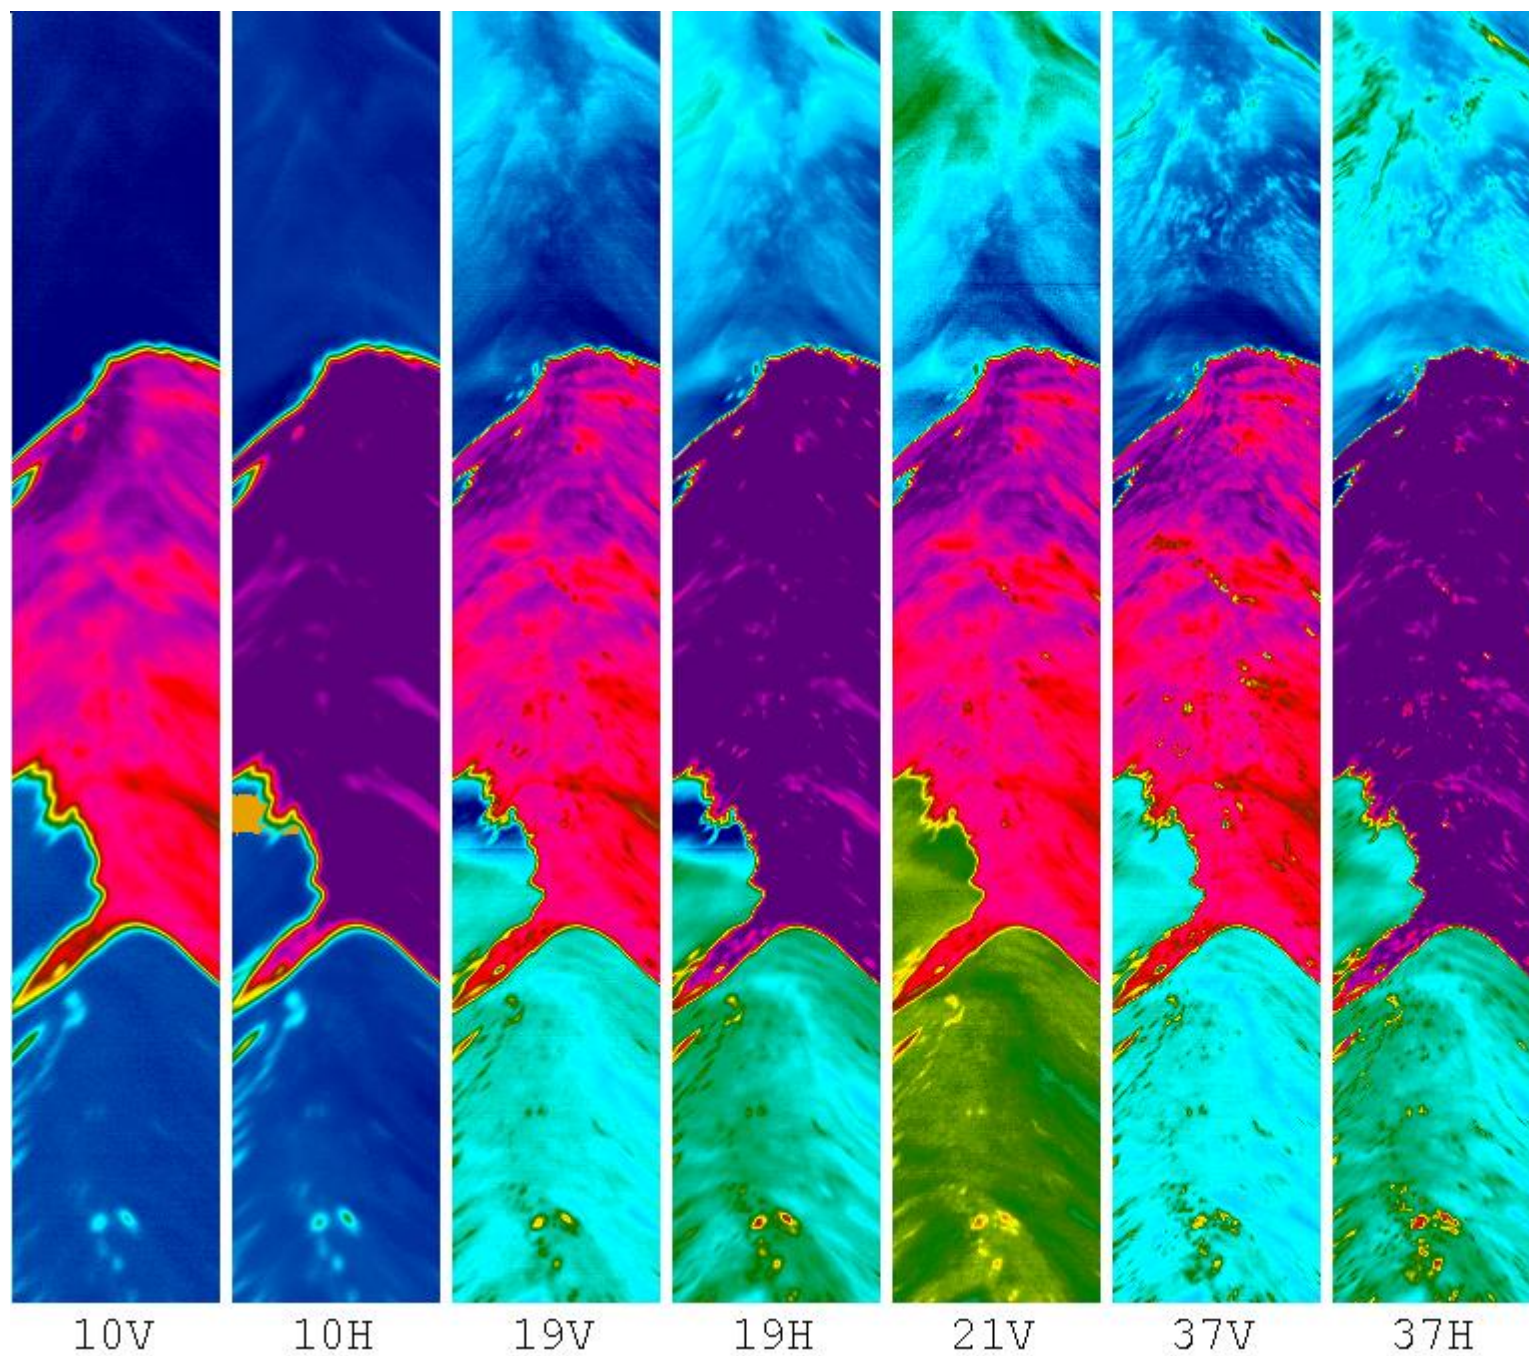

**We are Starting Prescreening on Level 1X data from GSFC/JAXA
Data became available about 2 weeks ago.**

Windsat July 2005

AMSR-E DATA

Lots of unphysical data at C-Band

What a surprise!

Some at X-Band

Otherwise pretty clean.
